The classic-resilient-curvature hybrid signal reconstruction (interpolation) formula is defined on a pixel-by-pixel basis depending on which one of the two:  $\hat{I}^{TM}(x)$  or  $R(x)$ , in 1D,  $\hat{I}^{TM}(x, y)$  or  $R(x, y)$  ...

The evidence consisted of: 1) the capability of the signal resilient to interpolation to smooth or to illuminate the MRI; 2) the capability of the resilient curvature to provide the MRI images with inverted, smoothed and magnified greyscale, which allows observation of the tumours with fine level of details.

describing the SRI: Signal Resilient to Interpolation, shows remarkable evidence of the possibility, the feasibility, and the accuracy of the calculation of all of the second order derivatives of the Hessian of the model interpolation function fitted to the signal data, on the basis of basic and simple, however rigorous concepts of ...

This new signal is dependent on the given model function and is called Signal Resilient to Interpolation (SRI). The book includes illustration of the math processes, logical reasoning, which show how to generate the Signal Resilient to Interpolation.

interpolation to fill the interval between the data points. It should be clear from the figure that a straight line or series of line segments do not represent the true shape or behavior of the data or function (possibly a natural law) that may be behind the generation of the values.

to a similar least-squares based interpolation as in [9], the signal processing perspective allows us to choose

an optimal objective criterion, which will be shown to lead to better interpolation.

And the interpolation process consists of replacing each sample by a rectangular signal, whose amplitude is equal to the sample size. So let's put one, first of all, at  $t$  equals 0 associated with that sample.
