An evaporative cooler (also swamp cooler, swamp box, desert cooler and wet air cooler) is a device that cools air through the evaporation of water. Evaporative cooling differs from typical air conditioning systems, which use vapor-compression or absorption refrigeration cycles. Evaporative cooling uses the fact that water will absorb a relatively large amount of heat in order to evaporate ...

What happens when sugar and salt are added to water? Pour in sugar, shake in salt, and evaporate water to see the effects on concentration and conductivity. Zoom in to see how different sugar and salt compounds dissolve. Zoom in again to explore the role of water.

Distillation is the process of separating the components or substances from a liquid mixture by using selective boiling and condensation. Distillation may result in essentially complete separation (nearly pure components),

or it may be a partial separation that increases the concentration of selected components in the mixture.

2 Between about 200 m and 1000 m depth, the temperature declines rapidly throughout much of the ocean. This region of steep temperature gradient is known as the permanent thermocline, beneath which, from about 1000 m to the ocean floor, there is virtually no seasonal variation and the temperatures are around 2 C.
